

Proposed workflow with explanation

This includes and applies Principles of management and scientific management for its solution

- Division of work and labour: to reduce the time taken to receive the complaint, to find the bug, to fix the bug, and to test the software. This helps in reducing the drain out of worker and improves efficiency and productivity.
- Placing people who are right for particular job or in other terms Specialisations increases efficiency
- Instead of having a developer, placing a developer to run a debugger software or an AI model that searches, fixes the bug and tests the software after debugging reduces a lot of time taken to debug.
- Skill-gap training becomes essential to improve the time taken.
- Also, promoting any creative way for solving the problem in an easy manner should also be welcomed.
